

## IN THE SPECIFICATION

Please replace the paragraph beginning on page 13, line 15, and ending on page 14, line 6, with the following amended paragraph:

C1 Referring again to Figure 2, each access request specifies a content file stored in the content server 31 using the Universal Resource Locator (URL) which is an address. The URL path for a content file stored in the content server 31, however, does not specify which version or format from which the content file will be accessed. This means that multiple content trees contain different versions of the same URL. The path to a particular URL in a given content tree will be the concatenation of the content tree name and the URL name, prefixed by the name of the root service directory of the content server 31. For example, two content trees may be created in the root service directory "/root", one being "/full\_content" and the other "/degraded\_content". The "/full\_content" content tree name directs the request to access the corresponding content file in the full content version or format. The "/degraded\_content" content tree name directs the request to access the corresponding content file in the degraded content version or format. In this case, a URL of "http://www.hpl.hp.com/my\_picture.jpg" may be served from either the directory "/root/full\_content/my\_picture.jpg", or from the directory "root/degraded\_content/my\_picture.jpg".
